

Instructions for use of the Stein Cartridge BB Handle Tool

The Cartridge BB Handle tool is used to install and remove various types of crank bearings from threaded bottom bracket shells. It can be used with any of the drivers which use a 32 mm hexagon drive. These include most of the Shimano and Lifu drivers with this driver dimension.

It can also be used with the Stein driver (part OB-32) for the outboard type bottom brackets. The OB-32 includes a spindle that can secure the CBBH to the outboard bearing sets to prevent slipping or misalignment of the splines.

To use the CBBH tool, insert the driver and secure it with the thumbscrew. Install the driver into the crank bearing to be removed or installed and secure the center bolt into the BB spindle or in the case of the OB-32, into the included spindle. Be sure of the thread direction and proceed to tighten or loosen the bearing cup as needed.
